BIOPHEN™ Factor XIII

REF 227005

[R1] 3 x 4 mL, [R2] 3 x 5 mL

Chromogenic method for the determination of Factor XIII.

**INTENDED USE:**
BIOPHEN™ Factor XIII kit is a chromogenic method for in vitro quantitative determination of Factor XIII activity in human citrated plasma.

**SUMMARY AND EXPLANATION:**
Technical:
Factor XIII (FXIII) protransglutaminase circulates in plasma as Aβ tetramer, at a plasmatic concentration from 14 to 28 mg/L, the A subunit being the functional form. When activated by thrombin and calcium to FXIIIa, it acts in the last step of the coagulation cascade and contributes to Fibrin crosslinking and clot stiffness.

Clinical:
FXIII deficiency may be congenital, or acquired as a result of hyperconsumption or presence of autoantibodies. Low FXIII levels have been associated with bleeding complications, e.g., in situations such as trauma or surgery. FXIII is also involved in various other processes such as wound healing and maintenance of pregnancy.

Assay of FXIII activity in human plasma may help in the diagnosis of congenital or acquired FXIII deficiency.

**PRINCIPLE:**
Factor XIII (FXIII), in the tested sample, is converted into activated Factor XIII (FXIIIa) by thrombin in presence of calcium². Soluble fibrin, also generated by the action of thrombin, accelerates the reaction while an anti-polymerization peptide avoids the formation of the clot. FXIIIa transglutaminase activity between a synthetic peptide substrate and glycine ethyl ester (GEE) leads to the formation of ammonia (NH₄⁺). Ammonia is then assayed through the reaction of glutamate dehydrogenase (GLDH) converting NADPH into NADP⁺, in the presence of ammonia and alpha ketoglutarate. The conversion of NADPH into NADP⁺ can be detected at 340 nm, and the slope of the absorbance decrease at 340 nm is directly proportional to the concentration of FXIII in the tested sample.

\[
\begin{align*}
\text{Thrombin, Ca}^2+ & \quad \rightarrow \quad \text{FXIIIa} \\
\text{Fibrin} & \quad \rightarrow \quad \text{FXIIIa} \\
\text{Glycine Ethyl Ester + peptide} & \quad \rightarrow \quad \text{Peptide-GEE} + \text{NH}_4^+ \\
\text{GLDH} & \quad \rightarrow \quad \text{NADP}^+ + \text{Glutamate + H}_2\text{O}
\end{align*}
\]

**REAGENTS:**
- R1 Thrombin reagent, lyophilized. Contains BSA.
- R2 Detection reagent, lyophilized. Contains BSA and GEE.
- R1 3 vials of 4 mL.
- R2 3 vials of 5 mL.

**WARNINGS AND PRECAUTIONS:**
- Some reagents provided in these kits contain materials of animal origin.
- Users of reagents of these types must exercise extreme care in full compliance with safety precautions in the manipulation of these biological materials as if they were infectious.
- Waste should be disposed of in accordance with applicable local regulations.
- Use only the reagents from the same batch of kits.
- Aging studies show that the reagents can be shipped at room temperature without evaporation, and stored closed, is of:
- Reconstitute the contents of each vial with exactly 5 mL of distilled water.
- Shake vigorously until complete dissolution while avoiding formation of foam and load it directly on the analyzer following application guide instruction.
- For manual method, allow to stabilize for 30 minutes at room temperature (18-25°C), homogenize before use.

**STORAGE AND STABILITY:**
Unopened reagents should be stored at 2-8°C in their original packaging. Under these conditions, they can be used until the expiry date printed on the kit.

**REAGENTS AND MATERIALS REQUIRED BUT NOT PROVIDED:**
- Distilled water.
- Physiological Saline (0.9% NaCl).
- Spectrophotometer or automatic analyzer for chromogenic assays at 340 nm.
- Stopwatch, Calibrated pipettes.

**SPECIMEN COLLECTION AND PREPARATION:**
The blood (9 volumes) should be carefully collected onto the trisodium citrate anticoagulant (1 volume) (0.109 M, 3.2%) by clean venipuncture. Discard the first tube. Specimens should be prepared and stored in accordance with applicable local guidelines (for the United States, see the CLSI H21-A5 guideline for further information concerning specimen collection, handling, and storage). For plasma storage, please refer to references.

**PROCEDURE:**
- The kit can be used for kinetics automated method. Perform the test at 37°C and read color intensity at 340 nm.

**ASSAY METHOD:**
1. Reconstitute the calibrators and controls as indicated in the specific instructions. For preparing the calibration curve, dilute the calibrator in physiological saline to calibrate from approximately 0 to 150% FXIII. The 1:2 working dilution in physiological saline (in the schema below) corresponds to definition by 100% for a normal plasma pool, or 0% FXIII for a commercial calibrator.

The point 3C/2 (or 150% for a normal plasma pool) is obtained by addition of 30 µL calibrator + 10 µL physiological saline in the table below.

2. Establish the calibration curve and test it with the quality controls. The exact calibrator and control concentrations for each batch are indicated on the flyer provided with the kit.
If a reaction volume other than that specified above is required for the method used, the ratio of volumes must be strictly observed to guarantee assay performance. The user is responsible for validating any changes and their impact on all results.

For an automated method, application guides are available on request. See specific application guide and specific precautions for each analyzer.

**CALIBRATION:**

The BIOPHEN™ Factor XIII assay can be calibrated for the assay of FXIII activity in plasma.

The calibration curve shown below, obtained on Sysmex CS-5100 analyzer, is given as an example only. The calibration curve established for the assay series must be used.

![Calibration Curve](image)

**QUALITY CONTROL:**

The use of quality controls serves to validate method compliance, along with between-test assay homogeneity for a given batch of reagents.

Include the quality controls with each series, as per good laboratory practice, in order to validate the test. A new calibration curve should be established, preferably for each test series, and at least for each new reagent batch, or after analyzer maintenance, or when the measured quality control values fall outside the acceptance range for the method. Each laboratory must define its acceptance ranges and verify the expected performance in its analytical system.

**RESULTS:**

- On Sysmex CS-series analyzer, the calibration curve lin-lin is obtained, with the OD 340 nm along the Y-axis and the FXIII concentration, expressed as %, along the X-axis.
- The concentration of FXIII (%) in the test specimen is directly inferred from the calibration curve, when the standard dilution is used.
- The results should be interpreted according to the patient's clinical and biological condition.

**LIMITATIONS:**

- To ensure optimum test performance and to meet the specifications, the technical instructions validated by HYPHEN BioMed should be followed carefully.
- Any reagent presenting an unusual appearance or showing signs of contamination must be rejected.
- Any suspicious samples or those showing signs of activation must be rejected.

**EXPECTED VALUES:**

The reference range established on healthy adult subjects (n=120) using Sysmex CS-5100 (Central 90%, 95th percentile) was measured between 60 and 146%.

However, each laboratory has to determine its own normal range.

**PERFORMANCES:**

- The lower analyzer detection limit depends on the analytical system used (<0.5% on Sysmex CS-5100).
- The measuring range depends on the analytical system used (about 5 to 300% of FXIII on Sysmex CS-series, the test being linear from 5 to 150% without restandardization).
- Performance studies were conducted internally on Sysmex CS-5100. Performance was assessed using laboratory controls over a 5-day period, 2 series per day and 3 repetitions within each series for a control level. The following results were obtained:

<table>
<thead>
<tr>
<th>Control</th>
