TFPI (Tissue Factor Pathway Inhibitor, type-I)

Determination of TFPI activity in plasma with chromogenic substrate BIOPHEN CS-11(22)

Measurement Principle

Human TFPI is a modular protein synthetized primarily by the vascular endothelium under normal physiologic conditions; small amounts are also expressed by monocytes and macrophages. The regulatory activity of TFPI is directed towards the extrinsic initiation pathway of the coagulation cascade involving binding and direct inhibition of factor Xa. It also inhibits the Tissue Factor/ factor VIIa complex in a factor Xa dependent fashion. TFPI expression can be modulated in several cell types in response to various inflammatory stimuli. In vivo TFPI is distributed in three pools: 80-85% is associated with endothelial cell-surface, and it is released into plasma after injection of heparin; 10% circulates in plasma primarily in association with the lipoproteins and a small amount in free form, and 3% is found in platelets. TFPI levels are elevated in pregnancy and lower in the new-born than those in the adult, while recently a significant reduction was found in woman taking combined oral contraceptives, suggesting a potential underlying cause for an increased risk for thrombosis. The role of TFPI in several thrombotic, inflammatory and malignant conditions is already established.

TFPI activity assay is based on the ability of TFPI in the sample to inhibit TF/FVIIa catalytic activity, in presence of FXa. Plasma is incubated for a prolonged time, allowing the formation of inactive TF/FVIIa/TFPI/FXa complexes. Fibrin polymerization inhibitor, I-2882, is added to prevent formation of cross-linked fibrin. After first incubation, residual TF/FVIIa catalytic activity is determined by the addition of FX and a selective chromogenic substrate, BIOPHEN CS-11(22).

\[
\begin{align*}
&\text{TF/FVIIa(Überschuss)} & \text{TFPI+Xa} \\
&\text{TF/FVIIa(Rest)} & \text{FX} \\
&\text{Bz-Ile Glu-Gly-Arg-pNA + H2O} & \text{FXa} \\
&\text{FXa} & \text{Bz-Ile-Glu-Gly-Arg-OH + pNA}
\end{align*}
\]

Reagents

1. TBS/BSA/Polybrene \textsuperscript{®} Buffer
   
   \(0.05 \text{M Tris-HCl, 0.15 M NaCl, pH 7.5, supplemented with 2.0 mg/ml BSA and 2.0 µg/ml Polybrene \textsuperscript{®}}\).
   
   Dissolve 6.057 g Tris base, 8.766 g NaCl, 2.0 g BSA, and 2.0 mg Polybrene \textsuperscript{®} in 900 ml H\textsuperscript{2}O, adjust the pH to 7.5 with 2 M HCl and top up to 1000 ml with H\textsuperscript{2}O

2. Acetic acid (50 % (V/V))
   
   Add 125 ml 100 % Acetic acid to 125 ml H\textsuperscript{2}O

3. CaCl\textsubscript{2} (50 mM)
   
   Dissolve 0.7351 g CaCl\textsubscript{2}-2H\textsubscript{2}O in 100.0 ml H\textsuperscript{2}O

4. Pefabloc\textsuperscript{®} Thrombininhibitor (1,5 mg/ml) - Art. No. P381-01-5MG
   
   Dissolve the vial content (40 mg) with 4.0 ml H\textsuperscript{2}O

5. Factor Xa, bovine (7,1 nkat/ml) - Art.No. BE101O
   
   Dissolve the vial content (71 nkat) with 10.0 ml H\textsuperscript{2}O

6. Recombinant Human Tissue Factor
   RecombiPlastin, Instrumentation Laboratory (Art.No. 49 73 27 50)
   
   Dissolve the vial content with 5.0 ml diluent

7. Recombinant Factor VIIa (30 kIE/ml)
   
   (NovoSeven, Novo Nordisk) Dissolve the vial content (240 kIE = 4.8 mg) with 8.5 ml diluent

8. Factor X, bovine (2 U/ml) - Art.No. BP102A
   
   Dissolve the vial content (2 U) in 1.0 ml H 2 O
Dissolve the vial content (25 mg) in 12.49 ml H₂O

10. HCl 2M

11. Normal plasma - Art. No. 223602

**Additional Material**

- Fridge or ice-bath
- Thermostat at 37°C
- Water bath at 37°C
- Microplates, flat-bottom
- Lids for microplates or Parafilm®
- Spectrophotometer 405 nm

**Specimen collection**

Blood (9 volumes) is mixed with 0.1 mol/l sodium citrate (1 vol) and centrifuged at 2000xg for 20 minutes at 20-25°C. Separate plasma carefully from the blood cells. Plasma can be stored in aliquots at -70°C.

**Standard curve**

1. Dilute Normal Plasma 1:10 with ice cold TBS/BSA/Polybrene® Buffer (Reagent 1)
2. Dilute this 1:10 dilution (= 10 %) further to 7.5 %, 5.0 %, 3.75 %, 2.5 %, 1.25 %, 0.625 % and 0.313 % with ice cold TBS/BSA Buffer/Polybrene® (Reagent 1).

Note: an aliquot of 100 µl of each dilution (10 % - 0 %) is sufficient for the standard curve.

**Preparation of the Combined Reagents**

(sufficient for 1 plate)

1. Factor VIIa 10µl
2. Tissue Factor 125µl
3. Factor Xa 125µl
4. Pefabloc TH 125µl
5. CaCl₂ 2500µl
6. TBS/BSA Buffer 7115µl

**Preparation of the Substrate Reagent**

(sufficient for 1 plate)

1. Factor X 0.65 ml
2. TBS/BSA Buffer 1.95 ml
3. CS-11(22) 2.60 ml
Method

The test tube method or the Microplate method can be performed by the acid-stopped or the initial rate method.

For the acid-stopped method: read the absorbance at 405 nm within 4 hours. If the plasma is icteric, hemolytic or lipemic, plasma blanks should be determined. Plasma blank is prepared by adding the reagents in reverse order starting with the acetic acid, without incubation. Subtract the absorbance of the blank from the absorbance of the corresponding sample.

For the initial rate method in test tubes: transfer sample immediately after addition of the substrate to a 1 cm semi-microcuvette (preheated at 37°C) for measurement of the absorbance change at 405 nm.

Calculation

Plot A or ΔA/min for the standards against their concentration of TFPI on linear graph paper. Read the TFPI value for the corresponding A or ΔA/min for the unknown test sample from the standard curve.
